

PLANTING

FLOWERING PLANTS IN ORNAMENTAL POTS

1 What do I need? Ornamental pots, plants, clay granules and potting compost.

2 First, place a layer of clay granules in the pots; this makes them lighter than filling the entire pot with potting soil.

3 This will also prevent the potting compost from being washed away with the water.

4 Then add a layer of potting compost.

5 Remove the plants from their pots one by one.

6 Plant them in the ornamental pot and fill the space between the rootballs with potting compost.

7 Water immediately, and thereafter water regularly.

8 The potting compost provides sufficient nutrients for around 6 weeks, after which you need to feed.
